Section:

FA24-BSE-5B

COMSATS University Islamabad, Vehari Campus

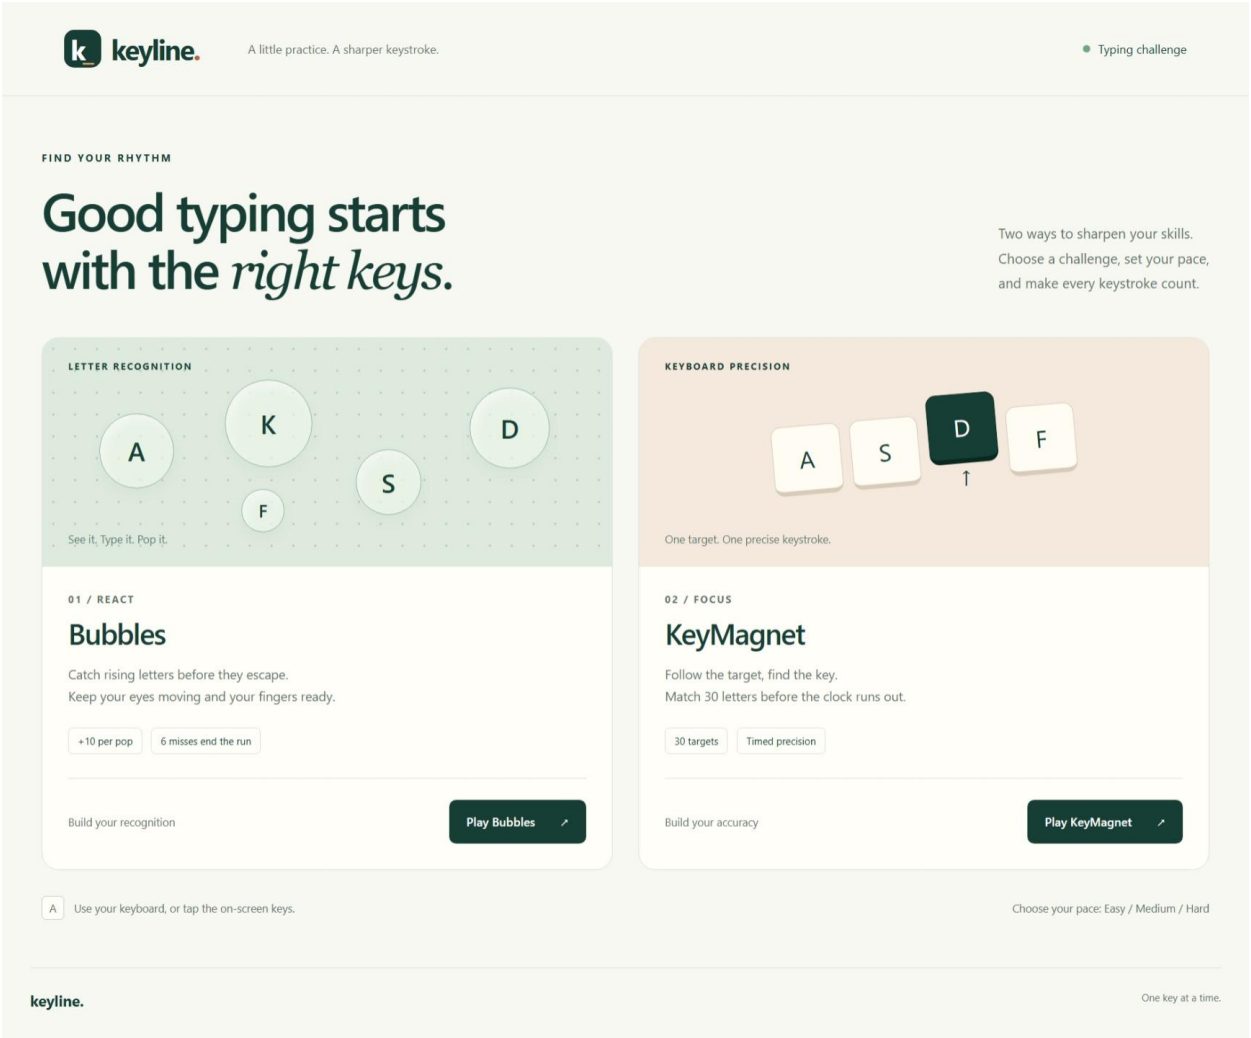

GitHub Repository:

https://github.com/datawithumerz/Keyline-Typing-Challenge

The demo video is large, so GitHub may not preview it. Download it from the repository to watch it locally.

1. Home Screen:

The home screen lists both game modes, each with its name, a short description and a Start button, so the player can choose a mode before playing.

2. Mode A: Bubbles (Letter Recognition):

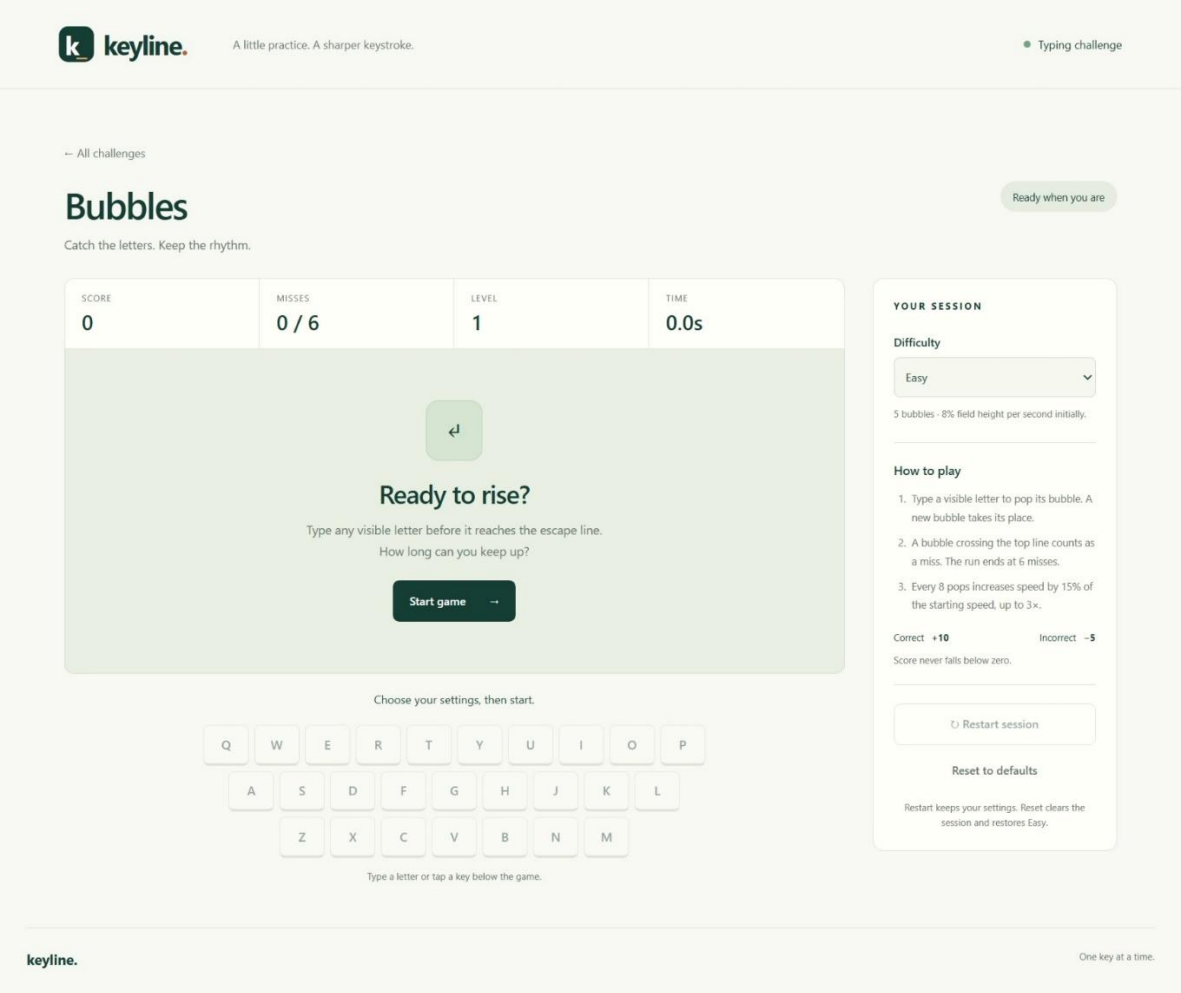

Gameplay:

Bubbles, each containing a letter, float upward across the screen. The player typeshown in a bubble to pop it before it reaches the top.

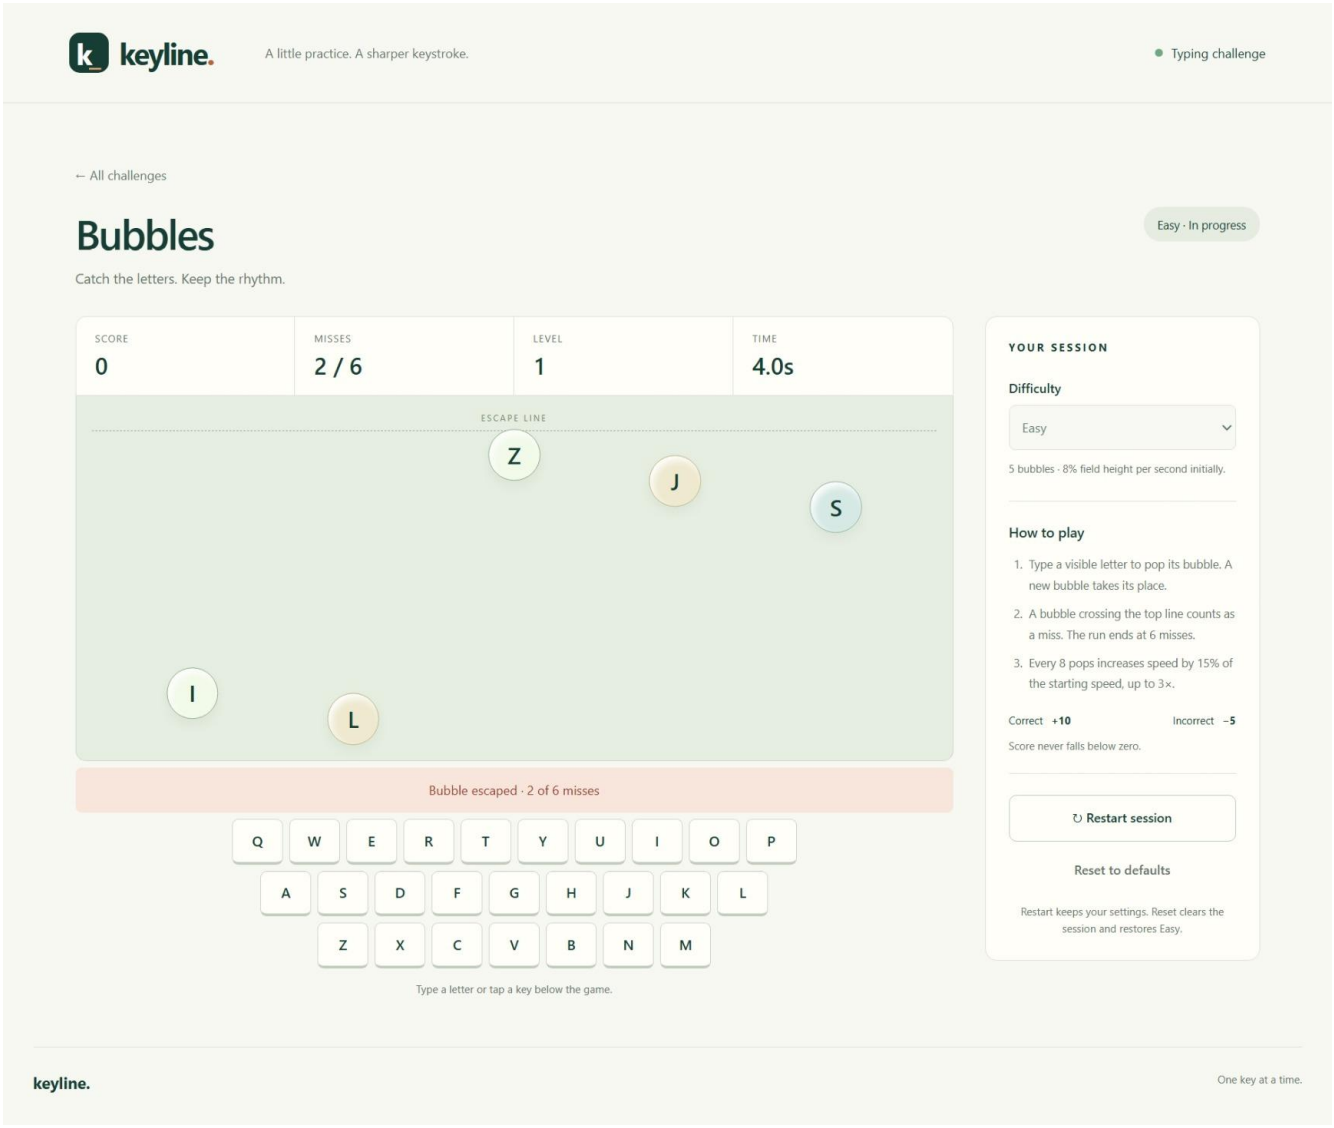

- Correct key: the matching bubble is removed and the score increases.
- Incorrect key: the player gets immediate visual feedback and a penalty is applied.
- Miss: a bubble that reaches the top counts as a miss; the game ends when the miss limit is reached.
- Difficulty: Easy, Medium and Hard change the gameplay, and difficulty also rises during play.

The status panel shows the live score, misses and difficulty. When the game ends, the results screen shows the score and performance statistics for the session.

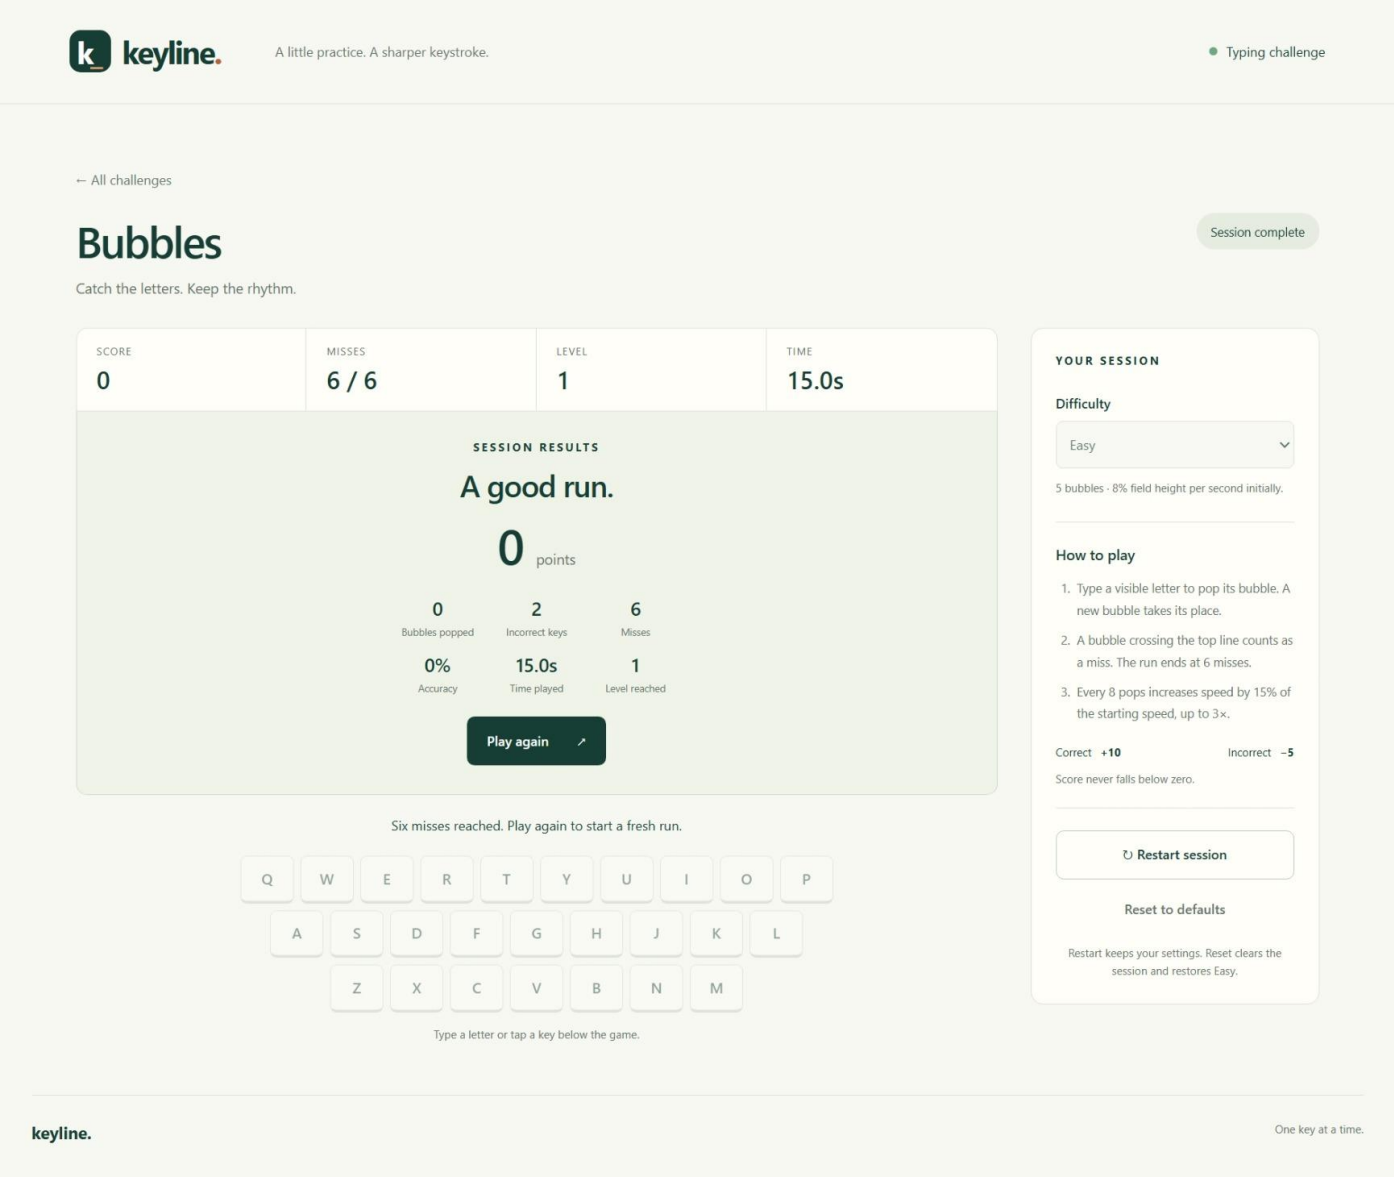

Bubbles before starting:

Bubbles results screen after the game:

3. Mode B: KeyMagnet (Keyboard Precision)

Gameplay:

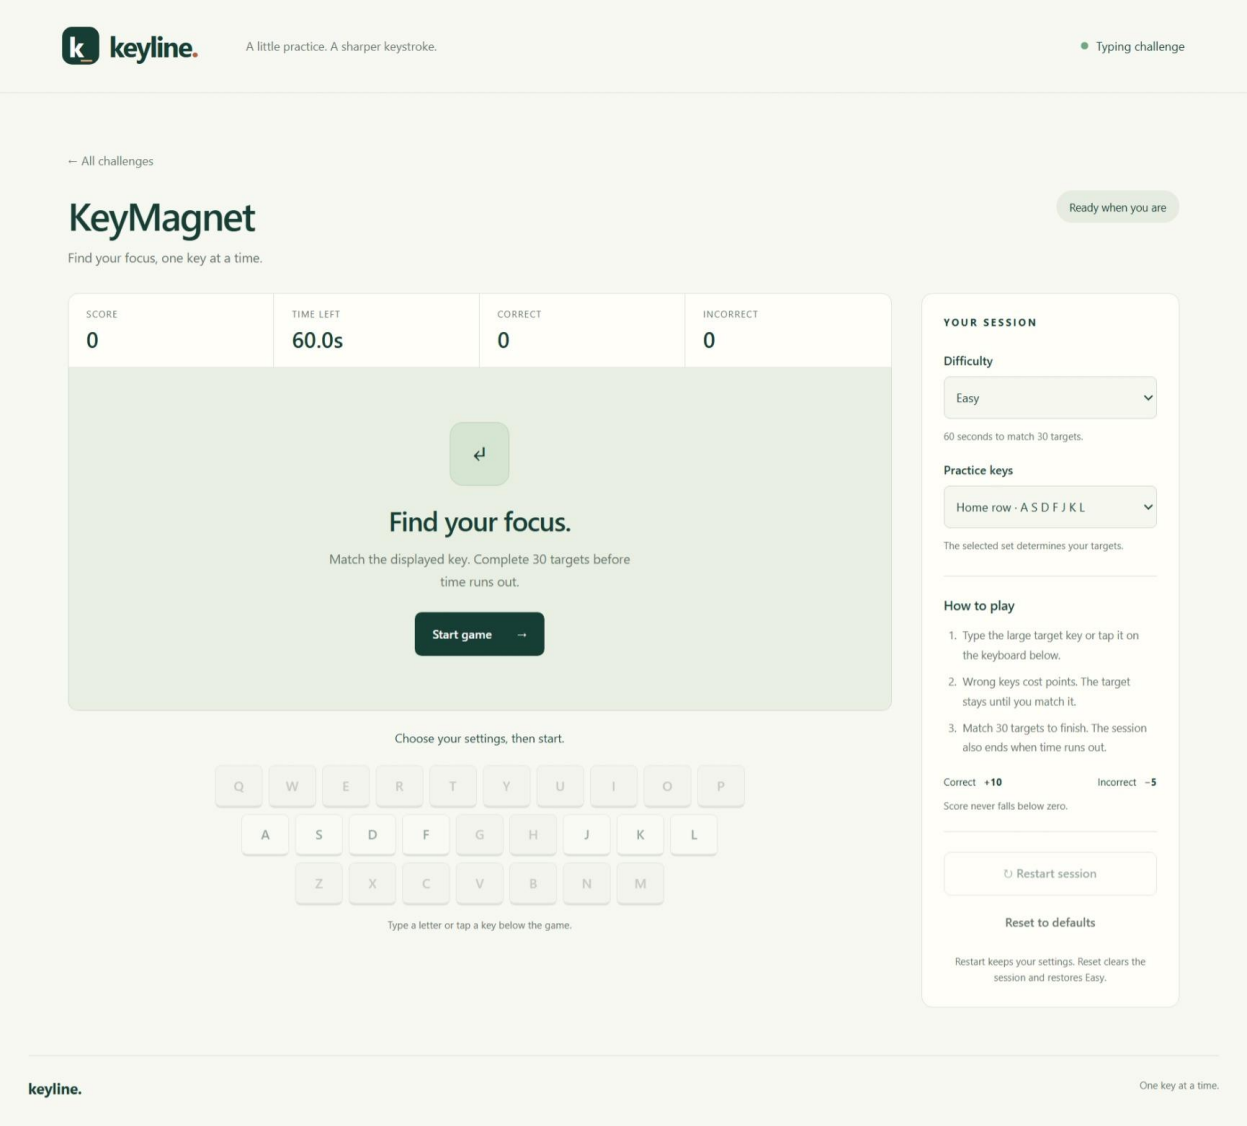

A target key is shown together with an on-screen keyboard. The player presses the matching key on the physical keyboard as quickly and accurately as possible.

- Target keys are generated from JavaScript arrays, including a home-row practice set (A, S, D, F, J, K, L).
- Correct key: points are awarded; incorrect key: immediate feedback is shown.

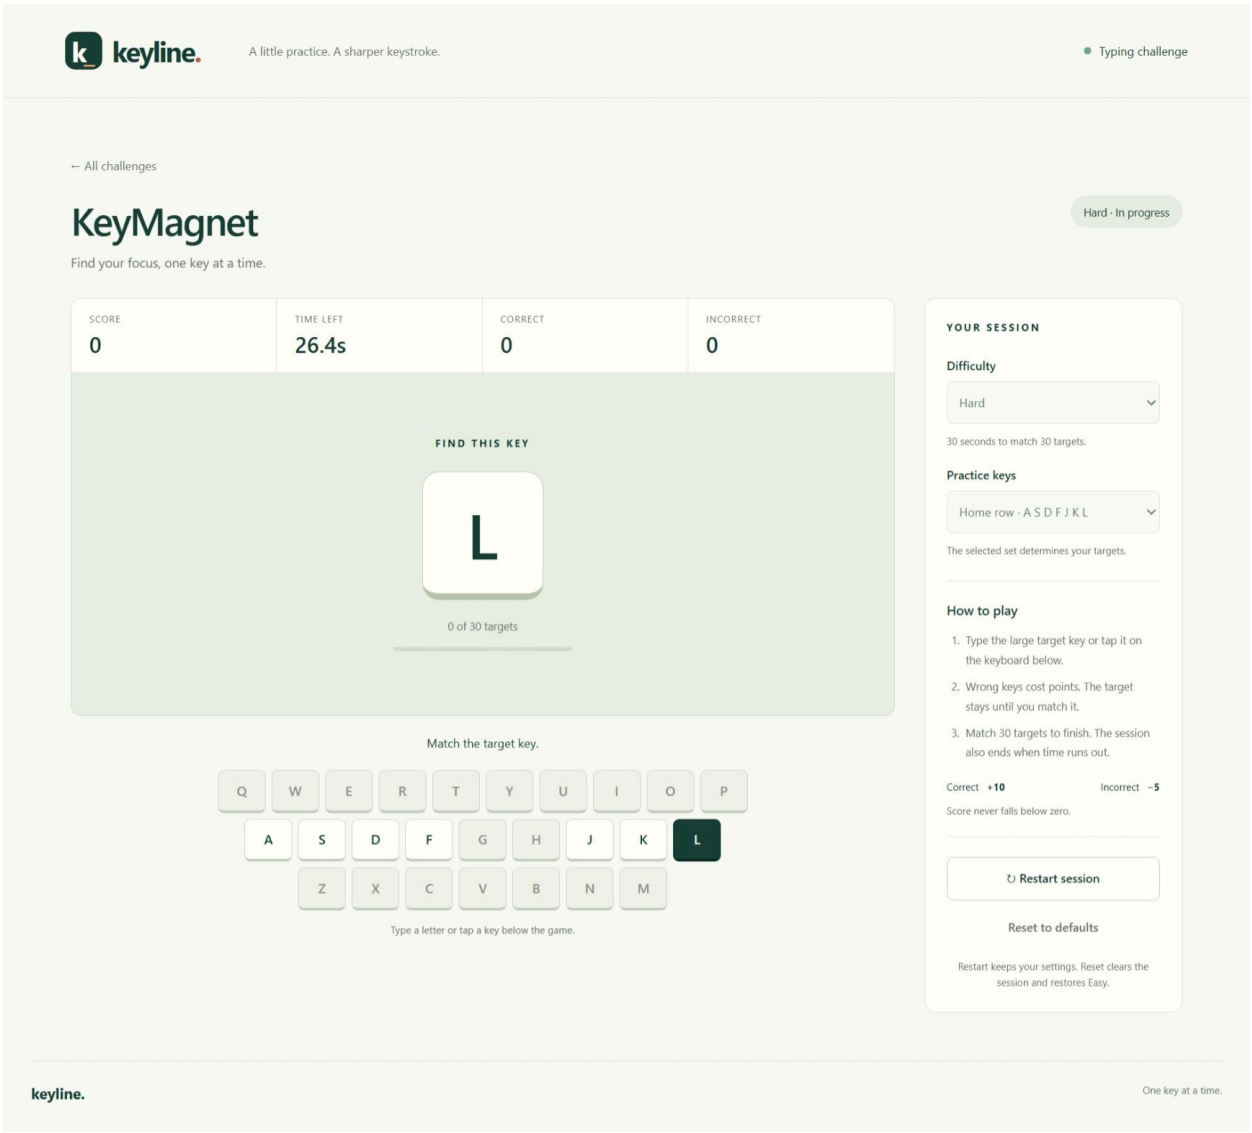

- Tracked statistics: correct responses, incorrect responses and response time.
- The selected key set or difficulty level changes the actual gameplay.

When the session ends, the results screen summarises the score, accuracy and response-time statistics.

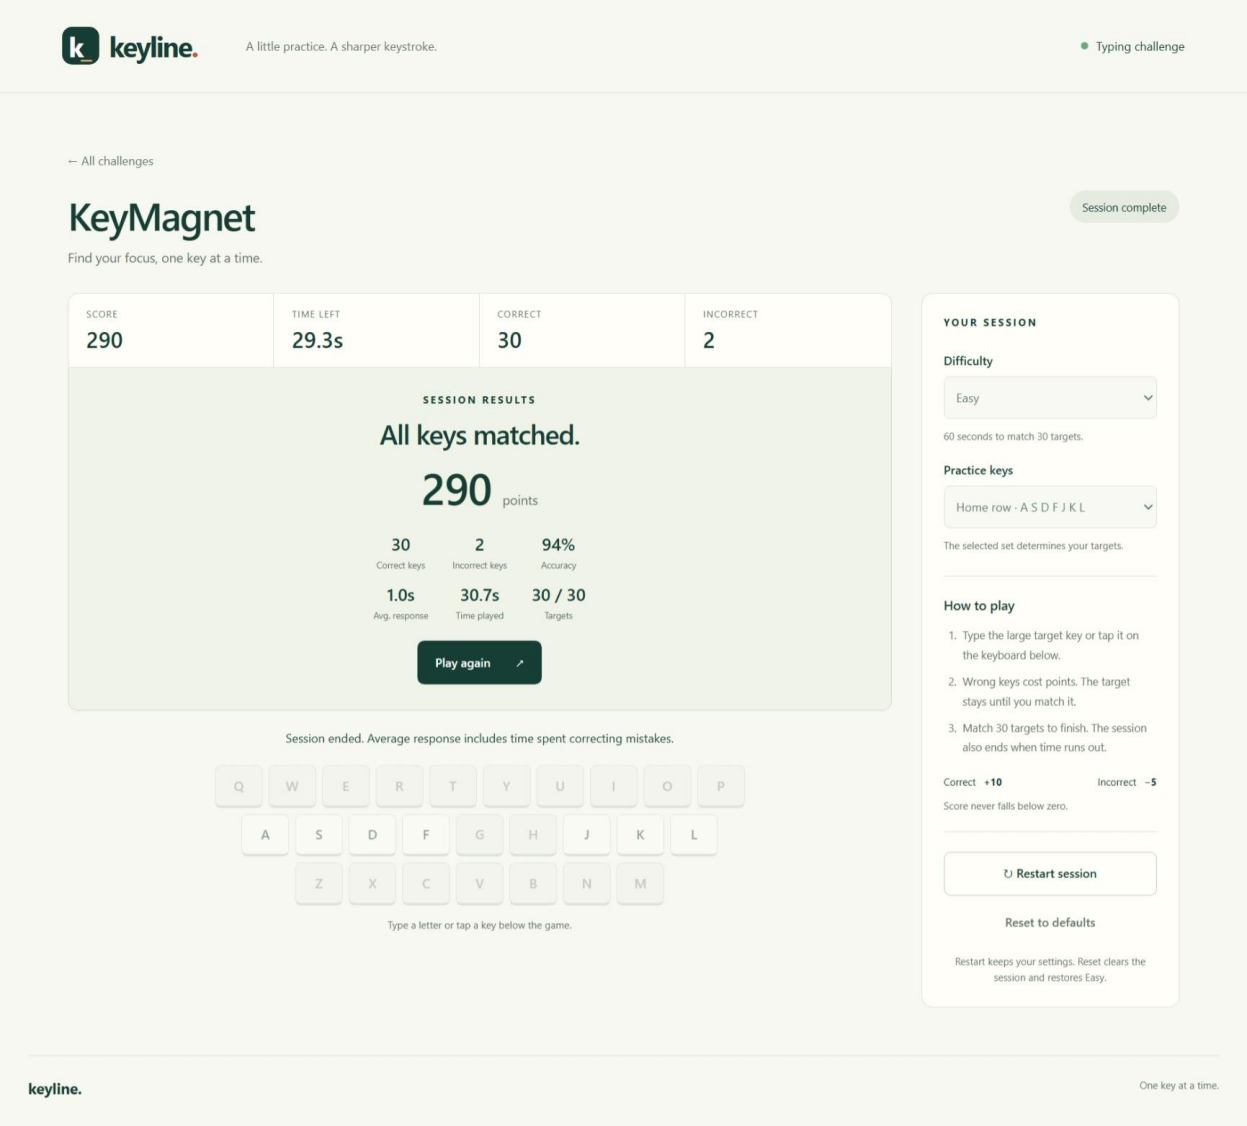

KeyMagnet before starting:

KeyMagnet during the game:

4. Demo Video:

The demo video shows the home screen, both modes, difficulty selection, a full game session for each mode, the feedback, the controls and the end-of-game results.

- **File:** video/keyline-project-explanation.mp4
- **Size:** 18.5 MB

5. Conclusion:

Keyline meets the lab requirements with two distinct modes, three difficulty levels, live scoring and feedback, reliable restart and reset, and a responsive layout built with HTML, CSS and JavaScript. The complete source code, screenshots and demo video are available in the GitHub repository.
